LQCD: Particle physics from a supercomputer

October 12, 2022 | Eric B. Gregory | FZJ

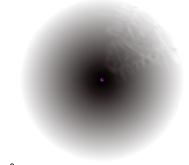

OVERVIEW

- A little bit of physics
- LQCD basics
- LQCD data challenges
- IO-SEA solutions

SOME QUICK PHYSICS

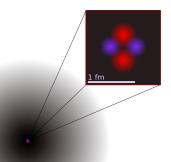

LQCD: Lattice quantum-chromodynamics

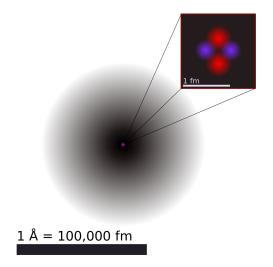

1 Å = 100,000 fm

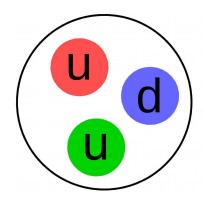

SOME QUICK PHYSICS

LQCD: Lattice quantum-chromodynamics

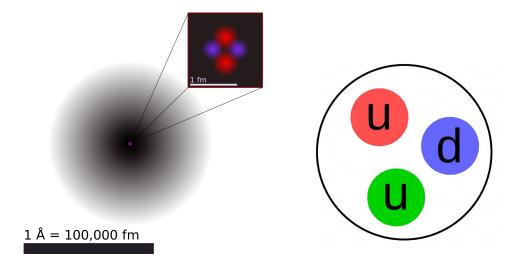

1 Å = 100,000 fm

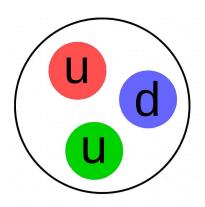

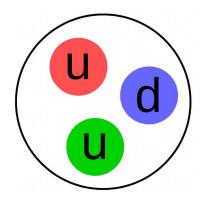

Proton is a *hadron*, a particle made of quarks bound together by the strong force.

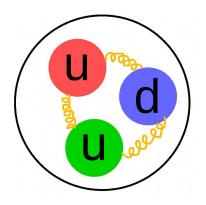

We say protons have the *quantum numbers* of three quarks:

We say protons have the *quantum numbers* of three quarks:

Quarks have a color charge, so-called because:

red+blue+green= neutral

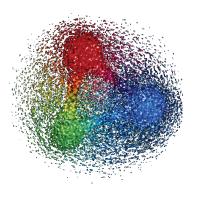

We say protons have the *quantum numbers* of three quarks....

Quarks have a color charge, so-called because:

Hadrons also have gluons contributing to their properties.

We say protons have the *quantum numbers* of three quarks....

Quarks have a color charge, so-called because

Hadrons also have gluons contributing to their properties.

For a complete understanding of a hadron, we must understand the quantum field fluctuations.

$$+M_{
m down}$$

$$\label{eq:mup} \begin{split} 2\times\textit{\textit{M}}_{\rm up} &+\textit{\textit{M}}_{\rm down} \\ 2\times(2.2~{\rm MeV}) &+(4.7~{\rm MeV}) &\approx 9~{\rm MeV} \end{split}$$

$$2 \times \textit{M}_{\mathrm{up}} + \textit{M}_{\mathrm{down}}$$
 $2 \times (2.2 \ \mathrm{MeV}) + (4.7 \ \mathrm{MeV}) \approx 9 \ \mathrm{MeV}$

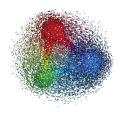

But ...

$$\textit{M}_{\rm proton} = 938 \; \text{MeV}$$

 $\textit{M}_{\mathrm{proton}} = 938 \; \text{MeV}$

$$2 imes M_{
m up} + M_{
m down}$$
 $2 imes (2.2 \ {
m MeV}) + (4.7 \ {
m MeV}) pprox 9 \ {
m MeV}$ But ...

$$\textit{M}_{\mathrm{proton}} = 938 \; \text{MeV}$$

To understand properties of hadrons, we must take quantum fluctuations into effect.

Properties of hadrons

- mass
- internal structure
- decay probabilities
- · ...

- Properties of hadrons

Physics beyond the Standard Model?

QCD ON THE LATTICE

Model is discretized 4-D box of (Euclidean) space-time:

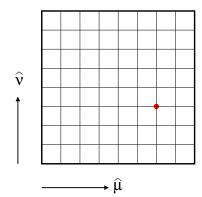

QCD ON THE LATTICE

Model is discretized 4-D box of (Euclidean) space-time:

• Quark fields $\phi(x)$ live on lattice sites 3 (or 3 × 4)-component, complex:

$$\phi(\mathbf{x}) = \left(\begin{array}{c} \phi_0 \\ \phi_1 \\ \phi_2 \end{array}\right)$$

QCD ON THE LATTICE

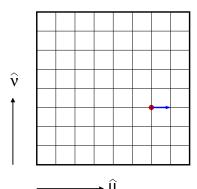

Model is discretized 4-D box of (Euclidean) space-time:

• Quark fields $\phi(x)$ live on lattice sites 3 (or 3 × 4)-component, complex:

$$\phi(\mathbf{x}) = \left(\begin{array}{c} \phi_0 \\ \phi_1 \\ \phi_2 \end{array}\right)$$

• Gauge fields $U_{\mu}(x) = \exp(iagA(x))$ live on links: (3×3)-component, complex

$$U_{\mu}(x) = \left(egin{array}{ccc} U_{00} & U_{01} & U_{02} \ U_{10} & U_{11} & U_{12} \ U_{20} & U_{21} & U_{22} \ \end{array}
ight)$$

Generate Markov chain of lattice gauge field configurations

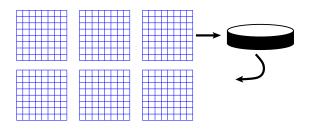

Generate Markov chain of lattice gauge field configurations

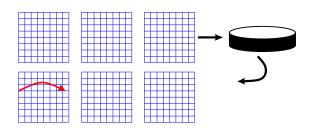

Generate Markov chain of lattice gauge field configurations

- Generate Markov chain of lattice gauge field configurations
- Save each to disk

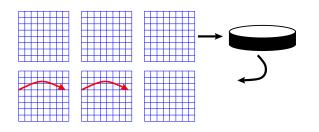

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk

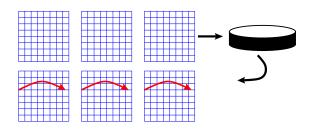

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$

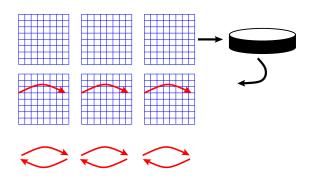

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$

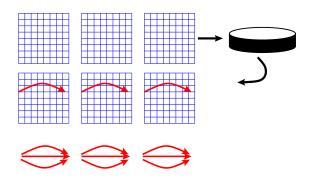

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$

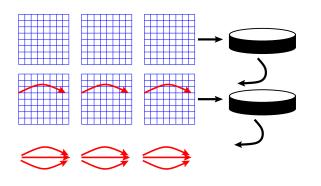

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$
- Contract propagators to generate hadron correlators C(t)

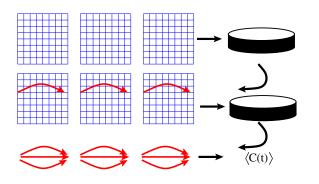

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$
- Contract propagators to generate hadron correlators C(t)

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$
- Contract propagators to generate hadron correlators C(t)

LQCD WORKFLOW

- Generate Markov chain of lattice gauge field configurations
- Save each to disk
- Load configuration files from disk
- On each, calculate quark propagators: $p(x) = M^{-1}(x, y)q(y)$
- Contract propagators to generate hadron correlators C(t)
- Average over ensemble gives expectation value
- Fit correlators to extract physical quantities, e.g., hadron masses

LQCD I/O AND DATA CHALLENGES

- lacktriangledown More lattice gauge field configurations $N_{
 m conf}$ \longrightarrow smaller statistical uncertianties
- More points in parameter space (m_q, β) \longrightarrow smaller systematic uncertanties
- LQCD is a very homogeneous problem with many available levels of concurrencies.
- Algorithms are highly scalable.

LQCD I/O AND DATA CHALLENGES

- Bigger lattice size: $V = N_x^3 \times N_t$
- lacktriangle More lattice gauge field configurations $N_{
 m conf}$
- More points in parameter space (m_q, β)

- → smaller systematic uncertainties
- \longrightarrow smaller statistical uncertianties
 - → smaller systematic uncertanties
- LQCD is a very homogeneous problem with many available levels of concurrencies.
- Algorithms are highly scalable.

If given the opportunity, LQCD practitioners will (easily) fill up your machine in search of more precise/accurate results.

LQCD I/O AND DATA CHALLENGES

Lattice size $V = N_x^3 \times N_t$

HMC step

A lattice gauge configuration file has:

$$V \times 4 \times (3 \times 3) \times 2$$
 real numbers (72 reals /site).
 $\uparrow \qquad \uparrow \qquad \uparrow$ dimensions color complex

For $V = 64^3 \times 128$, double precision:

 2.4×10^9 doubles; ~ 20 GB/file

Few $\times 10^3$ gauge configuration files per ensemble

Spectrum step

A propagator (or eigenvector) file has

$$V \times 4 \times 3 \times 4 \times 3 \times 2$$
 real numbers (288 reals /site)

$$\uparrow$$
 \uparrow \uparrow \uparrow spin color spin color complex

For $V = 64^3 \times 128$, double precision:

 \sim 10 — 100 per gauge configuration.

 9.7×10^9 doubles; ~ 80 GB/file.

LQCD IN THE IO-SEA ENVIRONMENT

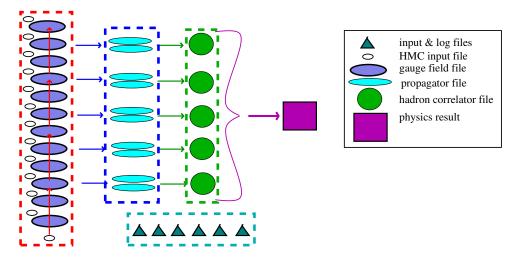

Data workflow on a traditional storage hierarchy

LQCD IO-SEA DATASETS

Group data in data sets (one possible solution):

LQCD EPHEMERAL SERVICES

POSIX NFS service

- Requires no re-coding of the LQCD I/O library
- Primary service to be used with LQCD application

BB-NFS

May provide benefit; will test on prototype

DASI interface

- Novel system of organizing data
- Possibly useful in organizing a sharable archive of lattice gauge field configurations
- Semantic keys include coupling constant β , quark masses m_q , lattice volume,...
- Would only use a stand-alone application, rather than re-coding

LQCD IN THE IO-SEA ENVIRONMENT

The "Workflow Description File":

```
# lgcd-BC-workflow.vaml
                                                                                                                                                                                     steps:
workflow.
                                                                                                                                                                                                            - name: "step_B_props-b{{\uBETA\u}}"

LQCD IN THE IO-SEA ENVIRONMENT

SUMMARY & OUTLOOK

- I/O challenges will increase as faster HPC platforms & algorithms allow larger problems to be tackled.
- IO-SEA ephemeral services should improve LQCD I/O bottlenecks and allow us to get the most from compute time allocations.
- Testing on prototypes to begin in the coming months.
